

Training For Plant Personnel and Engineers in Explosion Prevention

We offer a short 3 day Inspection course for plant personnel to assist them in:

- ✓ selecting explosion protected equipment correctly,
- ✓ to maintain the equipment correctly
- ✓ and to perform the 2 yearly inspections.

The first two days will be spent on the theory while the last day comprises a short practical inspection aimed at introducing the students to the marking and basic properties of each technique. Where possible this practical inspection is done on the plant.

The last day includes a short test to allow students to demonstrate what they learned after which they will receive a certificate.

We also offer a short 1 day Introduction course aimed at personnel who are not necessarily directly involved with maintenance of equipment but who work in hazardous areas. The aim is to make people aware of the specialized equipment and to help them detect (and prevent) damage to equipment.

We offer the courses at your site for minimal inconvenience and cost saving n accommodation and travel and will bring the training material with us. We kindly ask that a minimum of 5 people attend and we are comfortable with up to 12 persons per session.

Feel free to contact for a quote or additional information.

Kind Regards,

MTEEx Laboratories Team.
