**"Plant Maintenance Personnel Training Course" on inspection, maintenance
and installation of electrical equipment in explosion hazardous areas.
Code MTEEx301**

We offer an action packed 3 day Inspection course for plant personnel to assist them in:

- ✓ selecting explosion protected equipment correctly using the Area Classification,
- ✓ to maintain the equipment correctly; and
- ✓ to perform the 2 yearly inspections.

MTEEx Laboratories (an ISO17025, SANAS Accredited Test Laboratory (ATL) and DOL Approved Inspection Authority (A.I.A) offers an explosion prevention course specifically designed for engineers and technical personnel. This course provides access to updated information in the latest explosion prevention technique standards as well as installation codes. The presenters specialize in explosion prevention and have extensive experience in this field (CV's are available on request).

The first two days of the course will be spent on the theory behind explosion prevention while the last day will comprise a practical inspection (on your plant if possible!) aimed at introducing the students to the actual marking and basic properties of each explosion protection technique. The last day focuses on practical examples and a site visit if possible at your plant.

The last day will also include a short test - to allow students the opportunity to demonstrate what they learned - after which they will receive a training certificate that can be re-validated after 2 years.

To be cost efficient, courses are presented directly at the client's premises. We kindly ask that a minimum of 8 people attend and we are comfortable with up to 15 persons per session, but feel free to contact us if a custom course is required.

Visit our website and contact for a quote or additional information.

Kind Regards, MTEEx Laboratories Team.
